

1310 Fiber Single-mode Single Fiber

Overview

Single-mode 1310nm fiber can transmit signals up to 40km, while multimode fiber at 1310nm generally supports distances up to 2km. Additionally, SMF transceivers employ lasers, requiring careful handling for eye safety, whereas MMF transceivers typically use LEDs, which. Among the most commonly used fiber types are single-mode fiber (SMF) and multimode fiber (MMF), often paired with 1310nm SFP modules for high-speed data transmission. In this guide, we will explore the distinctions between 1300nm and 1310nm transceivers, examine the characteristics of SMF and MMF. A 1310nm optical module lets you move data efficiently through fiber optic communication networks. As part of the O-band (1260–1360 nm), it balances low dispersion, stable performance, and cost efficiency. It details the fiber's geometrical, optical.
