

Can gigabit and 10-gigabit optical modules communicate with each other

Overview

Theoretically, 10G optical modules should be able to be backward compatible with Gigabit optical ports, because the rate of 10Gbps can include the rate of 1Gbps. Compatibility heavily relies on the specific model of the switch. Generally speaking, SFP+ slots can accept SFP modules. However, they usually do so at a reduced speed of 1Gb. The Gigabit optical transceiver is an optical transceiver with a rate of Gigabit, the package form is SFP, and the transmission distance ranges from. First of all, we need to understand the basic concepts of 10G optical modules and Gigabit optical ports. For example, when using the AE-SFP-ZX160 optical module and LC duplex fiber optic patch cords, the maximum transmission. SFP port (electrical port and optical port) enables a gigabit switch to achieve fiber uplink over longer distances or short-range copper uplinks by inserting the corresponding SFP module (fiber SFP or copper SFP). Definitions: The Difference One “Plus” Makes SFP (Small Form-factor Pluggable) Originally designed to replace the bulky GBIC, the standard SFP supports speeds up to 1.
