

Check the optical module s transmit and receive signals

Overview

Execute the following command to view detailed interface and optical module status:
show interface <interface-type> <interface-number>Execute the following command to view detailed interface and optical module status: show interface <interface-type> <interface-number>An optical transceiver, also known as an optical module, is a device that converts electrical signals into optical signals for transmission over fiber-optic cables. It typically includes a transmitter and a receiver, each dealing with specific functions: Transmitter: Converts electrical signals. Check whether the optical module has been certified for Huawei Ethernet devices. If not, contact the supplier of the optical module. If the fault persists, reboot or power cycle. In modern fiber-optic networks, SFP modules (Small Form-factor Pluggable transceivers) are widely used to connect switches, routers, and servers to fiber or copper cabling. It enables flexible connectivity between networking devices and supports different speeds, wavelengths, and distances.
