

Cold aisle partitions for server racks

Overview

Containment panels or strips create a partition to isolate either the server supply air (cold aisle) or the exhaust air (hot aisle). Preventing the supply and exhaust air from mixing significantly increases the capacity and cooling efficiency of the cooling infrastructure. Essentially creating a room within the aisle, the system helps keep hot and cold air separated to make existing air conditioning systems in data center and edge-of-network. Frame components are pre-assembled and fully floor supported with rack attachments for lateral stability. Ergonomic angled handles reduce pinch points. It manages airflow at the source, increase Product Description Aisle containment in the data center requires that cabinets are aligned in a. Cold aisle containment (CAC) is a proven data center cooling strategy that creates physical barriers around cold air supply zones, preventing contamination from hot exhaust air and eliminating the energy-wasting effects of air mixing. The goal of a hot or cold aisle configuration is to conserve energy and lower cooling costs by managing air flow.
