

# Cooling methods for AI computing power servers

## Overview

The next generation of AI servers pushes the bounds of computational power at the cost of increasing power consumption, requiring the use of liquid cooling. This forces servers to slow down (a process called throttling) or even shut down completely. We will dive deep into liquid cooling technologies. Direct-to-chip and immersion. Advanced AI chips are generating more heat in data centers, necessitating improved cooling solutions. These servers are equipped with input and output piping and require an ecosystem of manifolds, CDUs (cooling distribution) and. Schneider Electric's data center liquid cooling solutions are purpose-built for AI workloads, GPU servers, and high-density IT environments. Collecting heat and rejecting heat efficiently is the key to saving energy, decreasing time to value, and lowering total.
