

Does the DDM optical module only have diagnostic functions

Overview

DDM or Digital Diagnostic Monitoring is a management technology which allows operators to monitor several parameters of a fibre optic transceiver, such as optical input/output levels, temperature, laser bias current and supply voltage. It can provide the host with real-time data about the module's internal operating conditions, including parameters such as voltage. By providing real-time, granular insight into the operational health of optical modules, DDM/DOM enables network architects, engineers, and administrators to shift from troubleshooting failures to practicing sophisticated, predictive maintenance. In practical terms, a transceiver with. Modern optical transceivers support standard digital diagnostics monitoring (DDM) functions, which enable real-time monitoring of modules' parameters. And the DDM information of the modules is commonly read via Simple Network Management Protocol (SNMP). After enabling the DDM function of.
