

Fiber Optic Cable Line Maintenance and Testing Items

Overview

Fiber testers provide the precision needed to install, certify, and maintain high-speed optical networks. This category includes OLTS certifiers, OTDRs, optical power meters, light sources, and visual fault locators. Fiber optic cable is a type of cabling that contains one or more optical fibers for transmitting data at high speeds and/or over long distances using light. These fibers are most commonly made of glass and are very thin, typically less than a tenth of the width of a human hair. Designed for singlemode and multimode applications, fiber testing tools help. Some people have suggested that fiber optic networks need periodic maintenance, including microscopic inspection of connectors and mating adapters and even insertion loss testing or taking OTDR traces. It could hurt an installer or get them sued by an irate network owner. Fiber Optic Cable Lifecycle Management: Scientific Monitoring and Preventive Maintenance Fiber optic cables are not “all set after installation”; their performance gradually degrades over time and due to environmental factors.
