

Fiber optic cable along rooftop duct

Overview

Recommended technical requirements are detailed by reference to IEC 60794-3-11 on outdoor optical fibre cables for duct, directly buried, and lashed aerial applications. Changes and additions to these requirements suitable to the duct and tunnel cable applications are recommended. Pulling and blowing a cable in a duct and the impact on the cable designs. Pulling has been the first technology for installing OF cables in duct. The innovative dry, gel-free design with water -blocking technology eliminates the need for. Duct fiber optic cables—often called “duct fiber”—are specialized optical cables engineered to be installed within pre-existing ducts (hollow tubes) rather than buried directly in soil or strung from poles. These ducts act as a protective pathway, shielding the fiber from environmental hazards. There are two basic methods of cable installation in a preinstalled duct – Pulling method and Blowing method. The cable installation method is selected based on site conditions and availability of machinery & resources. Mainly manual. Fiber optic cable is usually (but not always) installed in an innerduct that provides mechanical protection for the fiber optic cable.
