

Goose Relay Protection Applications

Overview

GOOSE is designed to carry protection signals such as trips, interlocks, blockings, permissives, and alarms with very low latency and high reliability, replacing copper hardwiring in digital substations. GOOSE is not a request/response protocol. It is publisher-subscriber. It is used to exchange fast, event-driven messages between protection IEDs, bay controllers, and automation devices. A real incident.

Abstract—IEC 61850 GOOSE (Generic Object-Oriented Substation Event) provides many advantages, including flexibility and reduced wiring, but introduces new challenges. Traditional tools and techniques cannot check the status of contacts and coils between intelligent electronic devices (IEDs) in. GOOSE is a multicast communication protocol designed for high-speed, event-based messaging in substations. GOOSE operates on Layer 2 of the OSI model (Ethernet), which means it is. This document describes the utilization of some new features offered by IEC 61850, Communication Networks and Systems in Substations.
