

How long should the optical cable be left in the ODF frame

Overview

Operations must adhere to principles within the ODF frame, optical cross box, a neat combined test cabinet, ensuring beautiful wiring, easy operation, and minimal space usage. Fiber patch cord length should be within the range of 500mm. It ensures fiber management is structured, minimizes signal loss, and provides accessibility for maintenance and future expansion. ODF Rack/Cabinet: Physical frame housing all terminations and. For fibers routed above, they should exit below the ODF frame and go upwards inside the frame, running horizontally below the ODM and vertically up to the corresponding terminal. Patch cables should only ascend once inside and once outside the ODF frame without wrapping or hanging across multiple. ②Cut off the end of the optical cable about 1m long. Then take the appropriate length (about 1500mm), peel off the outermost jacket, insert the ground wire barbed end into the stripping position of the optical cable (slightly cut the sheath with a blade), and wrap it tightly with film to ensure. An Optical Distribution Frame (ODF) is the physical heart of any structured fiber network.
