

Insert-type 1-to-2 optical splitter

Overview

A fiber optic splitter 1×2 is a passive optical device that takes a single input signal and divides it into two output signals. These splitters are widely used in point-to-multipoint configurations such as Fiber to the Home (FTTH), data centers, and enterprise LANs. A deeper understanding of these. In the backbone of modern Fiber-to-the-Home (FTTH) networks, optical splitters serve as the unsung heroes that enable cost-efficient connectivity for millions of subscribers. T PON standards such as GPON, XGS-PON and new 25 and 50G standards. A fiber broadband provider typically determines and overall split ratio for the network, such as 1x32 or 1x64, and uses combinations of splitters to meet that ratio with each PON port. 1x32 splits were common in North America for G-PON architectures.
