IRENA identifies five key areas in which digital technologies can transform power systems: monitoring through smart sensors and metres; AI-enhanced forecasting for demand and renewable generation; operational optimization to reduce losses and congestion; end-use automation for demand. The EU is promoting the availability of safe, secure, and sustainable digital energy services. Digitalisation has an impact across the energy value chain, from generation to transport, distribution, supply and consumption. A system-wide approach and EU countries' support to promote cooperation. The digital transformation of energy systems is no longer optional but a "decisive enabler" of electrification and decarbonization, according to a new report from the International Renewable Energy Agency (IRENA). Moreover, digital services like videoconferencing offer. Energy supply is the backbone of society and industry. The high market. According to the International Energy Agency (IEA), AI-related chips have doubled their efficiency every three years, and recent models use 99 percent less power to perform the same calculations as a similar chip from 2008.
