

Metal grounding process for distribution box casing

Overview

26 mm² (10 AWG) ground wire must be used, and in all other markets a 6 mm² must be used. During the manufacturing process, metal enclosures typically have fixed points welded to the base plate or side walls. Before starting, gather the correct components for a safe and compliant installation. The primary hardware is the. The grounding system provides a low-impedance path for fault current and limits the voltage rise on the normally non-current-carrying metallic components of the electrical distribution system. Each DISTRIBUTION BOX and controller must be grounded. Grounding of the units: Attach a ground wire from one of. Grounding is vital for two primary reasons: Personal Safety: Proper grounding ensures faults are quickly cleared by circuit breakers or fuses, reducing the risk of electric shocks and fires.
