

Multimode fiber optic interface flange attenuation

Overview

This chapter describes how to calculate the maximum allowable loss for an fiber optic link that uses multi-mode components. This Applications Engineering Note (AE Note) discusses the criteria for properly selecting the optimal multimode fiber (MMF) for enterprise applications. All multimode fibers utilizing the above nomenclature should. Panduit OM2 and laser-optimized OM3, OM4 and Signature Core™ multimode fibers exceed domestic and international standards for optical fiber, including TIA-492AAAB, TIA-492AAAC, TIA-492AAD and IEC 60793-2-10. They support a diverse set of legacy and contemporary applications including Ethernet. Per current standards and specs, maximum supportable distances and attenuation for optical fiber applications by fiber type. Not included are many proprietary designs. Designs under development are listed below. Interfaces with multimode optics typically use LEDs as light sources. There are different techniques for joining fiber ends: Permanent and stable connections with very low insertion losses can be obtained by fusion splicing.
