

# Mutual protection of relay protection

## Overview

The IEC standard for relay coordination provides clear guidelines and methodologies to ensure that protective relays work in harmony to isolate only the faulty section of the system while keeping the rest of the network operational. Protective relays and devices have been developed over 100 years ago to provide “lastline” of defense for the electrical systems. These relays may sometimes be set based in percentages of the line impedances, for example a typical setting for zone 1 is 80% of the impedance of the line in order to not reach the remote end, the zone 2 can. Relion protection and control relays for several application reduce complexity. Applications of the concepts to accepted transmission line-protection schemes are also presented.
