

OM4 and OM5 fiber optic patch cords

Overview

OM5 fiber optic patch cable is designed for wideband operation and advanced network architectures. networks planning for advanced data center designs and long-term scalability. They are available in multimode (OM1, OM3, OM4, OM5) and single-mode (OS2) fiber types, with a range of SC, ST and LC connectors., which can be. Multimode fiber comes in different types, and the most common are OM2, OM3, OM4, and OM5. All four use a 50-micron glass core, but they do not perform the same. That difference matters when you choose cabling for a data center, enterprise backbone, or. With the growing demand for high bandwidth and high speed applications in data centers, OM5 fiber optic patch cords will become the new multimode fiber optic patch cord used for high-speed data center applications, which has attracted widespread attention in the industry. OM1, OM2, OM3, OM4, OM5 or OS2 fiber types are available to meet the demand of. These differences include the maximum distance and speed, the standard release date, the modal bandwidth, the size of the fiber core, the color of the fiber jacket, and the typical applications from a data rate perspective.
