

Optical Electro-optical hybrid cable splicing method

Overview

As a best practice, fusion splice the optical fibers of the same color at the hybrid copper-fiber switch side, and fusion splice the optical fibers of different colors at the powered device side. A main cable is used for long-distance cabling from the switch. Recommendation ITU-T L. 1 explains the type II optical/electrical hybrid cable (OEHC) in which a copper pair is used for power delivery (not for telecommunications) and an optical fibre can support data transmission up to and beyond 1 Gbit/s. Combining them in this manner makes installation easier, reduces cabling density, and provides a more stable. Fiber optic splicing is the process of joining two fiber optic cables together so that light signals can pass with minimal loss or reflection. The goal is to achieve the lowest possible optical loss (signal).
