

Optical Module Performance at Different Wavelengths

Overview

The wavelength of an optical module determines the transmission characteristics of the optical signal in the fiber. Common wavelengths include 850nm, 1310nm, and 1550nm. Optical modules with different wavelengths are suitable for different types of fibers and application scenarios. That value determines whether the module is designed for multimode fiber (MMF) or single-mode fiber (SMF), how much attenuation the signal will experience, how dispersion behaves over distance, and. Average Optical Power: How bright the light is (measured in dBm). Too bright?

You risk damaging receivers. Extinction Ratio: The difference between “on” (1) and “off” (0) light power. A higher ratio = cleaner signals (typical range: 8. The wavelength of an. CWDM, which stands for Coarse Wavelength Division Multiplexing, is a technology with a wavelength rang between 1270nm and 1610nm, with a wavelength spacing of 20nm.
