

Optical cable turning direction

Overview

Turn-backs and all sharp changes of direction should be avoided. If the cable remains outside for more than 24h during installation protective material should be used to prevent cable damage. Avoid pulling cables over edges. In fiber optics, polarity is directional; light signals travel through a fiber optic cable from one end to the other. Although it may seem obvious, fiber optic polarity is a frequent source of confusion and. Use proper pulling techniques in laying out your cable. Just remember these rules: Never pull on the connector. For this signal alignment to work. For loose tube and ribbon cable, the bend radius is specified at 20 times the cable diameter during tension/installation conditions and 10 times during static conditions (check the data sheet).
