

Stability of Fiber Optic Splitters

Overview

Stability assessment is another essential aspect of evaluating the performance of fiber optic splitters. A splitter is. In FTTH architectures, splitters determine how optical power is distributed from a central feeder fiber to multiple subscriber branches. Each additional output branch increases theoretical. What Is a Fiber Optic Splitter?

A fiber optic splitter is a passive optical component that divides a single incoming optical signal into two or more outgoing signals, or combines multiple incoming signals into one. Unlike active devices (which require power), splitters operate without electricity. A passive device used to split or combine signals on fiber optics may be called a splitter, combiner or coupler, but splitter is the most common term. To analyze the uniformity of a.
