

Testing for equipment at the end of the optical cable

Overview

Have the right tools and test equipment for the job. Reference test cables that match the cables to be tested. Fiber optic cabling is the high-performance core of today's datacom networks. Fiber testing is more important than ever. As the components like fiber, connectors, splices, LED or laser sources, detectors and receivers are being developed, testing confirms their performance specifications and helps. Regular testing of fiber optic cables is not just a preventive measure; it's an investment in the longevity and efficiency of your network. It helps minimize downtime, reduce maintenance costs, and support system upgrades or reconfigurations. If it's a long outside plant cable with intermediate splices, you will probably want to verify the individual splices with an OTDR also, since that's the only way to make.
