

The three-layer architecture of the core switch includes

Overview

It contains three layers: core, distribution, and access. In a three-layer hierarchical model for Cisco routers, The first layer is the local area network (LAN) that uses IEEE 802.3 Ethernet technology to connect devices on the same physical segment (or subnet). This low level of networking provides easy sharing of media and files between individual. Cisco suggests a Three-Tier (Three Layer) hierarchical network model, that consists of three layers: the Core layer, the Distribution layer, and the Access layer. The. A core switch is the backbone of a large-scale network, designed to handle massive volumes of traffic with ultra-low latency and maximum reliability. Each of layers has its own features and functionality, which reduces network complexity.
