

# WDM optical transmission network has three layers

## Overview

The image highlights three fundamental layers of OTN that work together to transport data: ODU Layer – Multiple Service Transport OCh Layer – Wavelength Switching WDM Layer – Physical Optical Multiplexing Let's discuss each layer in detail. ODU Layer – Multiple Service Transport The diagram titled “The multiple layers of the OTN network” clearly illustrates how the various layers within the OTN framework work together to ensure smooth transport of different client signals, including Ethernet, Fiber Channel, MPLS/IP, and SDH/SONET. The Optical Transport Network (OTN) is. Wavelength division multiplexing (WDM): The WDM technology multiplexes optical signals of different wavelengths into one fiber for transmission (each wavelength carries one service signal). This technique enables bidirectional communications over a. An optical transmission system has three basic components—transmitter, transmission medium, and receiver—as shown in Fig. Its principle is essentially the same as Frequency Division Multiplexing (FDM). That is, several signals are transmitted using different carriers, occupying non-overlapping parts of a frequency spectrum.

A WDM system uses a multiplexer at the transmitter to join the several signals together and a demultiplexer at the receiver to split them apart. With the right type of fiber, it is possible to have a device that does both simultaneously and can function as an optical add-drop multiplexer.
