In factories, construction sites, and even commercial buildings, this question pops up all the time. Your boss might insist on it, while your. There are two kinds of grounds; both are required by the OSHA construction standard: System or Service Ground: In this type of ground, a wire called "the neutral conductor" is grounded at the transformer, and again at the service entrance to the building. This is primarily designed to protect. Normally you use a Rigid Metal Conduit nipple, and the RMC nipple just handles grounding for you. Make sure each box is tight and does not move. Always use covers that fit well. This keeps people from touching live wires by mistake.
